

ABSTRACT OF THE DISCLOSURE

A putter comprises a shaft comprising an upper longitudinal groove; a T-shaped grip comprising a bar including a cavity with a first bearing fitted therein, an opposite, threaded projecting cylinder, and a longitudinal channel
5 matingly engaged with the groove; an abutment assembly adapted to urge against a golfer's body and comprising a cylindrical projection having a peg fastened in the cavity; a sleeve including a recess and a nut; and a second bearing fitted in the recess wherein the cylinder passes the second bearing and the sleeve to theradedly secure to the nut; and a bifurcated head pivotably
10 coupled to the shaft for permitting an angle adjustment therebetween. The invention enables even a novice to easily put the ball into the hole while playing since the hit ball tends to roll in a direction as expected.
